

Pushup Tracker

One-page repo-based summary generated from code, config, and schema evidence.

What It Is

A Next.js web app for tracking bodyweight workouts, centered on pushups but also supporting pullups, crunches, squats, and plank.

It combines workout logging, progress analytics, structured training programs, and social competition features.

Who It's For

Primary persona: Not found in repo.

Inferred target user: a person training bodyweight exercises who wants daily tracking, progression, and accountability with friends.

How To Run

- Install deps: `npm install`.
- Create `.env` from `.env.example`; set at least `DATABASE_URL`.
- Start PostgreSQL. Repo option: `docker compose up -d db`.
- Prepare Prisma: `npx prisma generate` and `npx prisma migrate deploy`.
- Run the app: `npm run dev`, then open `http://localhost:3000`.

What It Does

- Logs workouts by date/time and exercise type via `/api/workouts`.
- Shows dashboard totals, streaks, calendar history, and workout reward messages.
- Generates structured training programs with scheduled sessions and per-set targets.
- Provides progress analytics with KPIs, trends, insights, and exercise filters.
- Supports friends, follow/unfollow, workout feed, and emoji reactions.
- Runs invite-based challenges with modes: most, target, daily minimum, and sets minimum.
- Includes in-app notifications plus optional web push and SMTP email notifications.

How It Works

- UI layer: Next.js App Router pages in `src/app` and shared components in `src/components`; `src/app/layout.tsx` wires auth, locale, nav, service worker, and wake lock.
- Request flow: browser pages fetch internal `/api/*` routes for workouts, programs, friends, challenges, notifications, profile, and push settings.
- Auth/data access: route handlers use session-cookie helpers in `src/lib/auth.ts`, then read/write through Prisma in `src/lib/prisma.ts`.
- Persistence: PostgreSQL models in `prisma/schema.prisma` cover users, sessions, workouts, friendships, follows, notifications, training programs/sessions/sets, rewards, and push subscriptions.
- Supporting services: training logic in `src/lib/program.ts`, analytics helpers in `src/lib/analytics/*`, web push in `src/lib/web-push.ts`, SMTP email in `src/lib/notification-email.ts`, PWA caching/push in `public/sw.js`, and containerized runtime in `docker-compose.yml`.
